

H-CORE PROPOSED LAWS OF NATURE GUT

By Mike C Pavledis © 2008

The Grand Unified Theory that seemed to have a fair chance of success was shelved because the *proton* is not shown to have been formed within currently accepted scientific parameters.

However when one postulates that Space is basic energy, which is arguably so because of the accepted existence of the neutrino, dark energy and compelling logical argument, a door is open to the visualisation of some very obvious events that must have taken place prior to the Big Bang (BB).

From this stance we can logically predict that *Gravity is the result of the mechanism of spherical collapse* that gave birth to the universe. This is the key factor in the formation of the proton and other forms of the observed and yet to be identified forms of energy.

<h-core.org> (Protons Electrons).

Hence --

THE THREE LAWS OF NATURE

1st *Quantum Spatial Energy is The Fundamental of Existence that forms the matrix of all space, -- the first environment.*

2nd *Gravity is initiated when a large enough volume of energy is sufficiently spherically compacted by surrounding pressure to form a central body with a density variance thus forming an external self propagating energy sump; gravity. The body of matter that thus so formed the universe is seen as the second environment,*

3rd *The wedging mechanism of the spherical centripetal collapse of a large body of energy creates the directional flow that is a feature of the proton that is one of several forms of restructured energy that may appear during its disintegration and expansion. Such circumstance initially created the universe, -- the third environment.*

This argument can be clarified and reinforced by logically showing different stages of energy's potential evolution prior to the BB and relating them to the present. Everything fits together and *clarifies the quantum gravity connection with the other three forces.*
